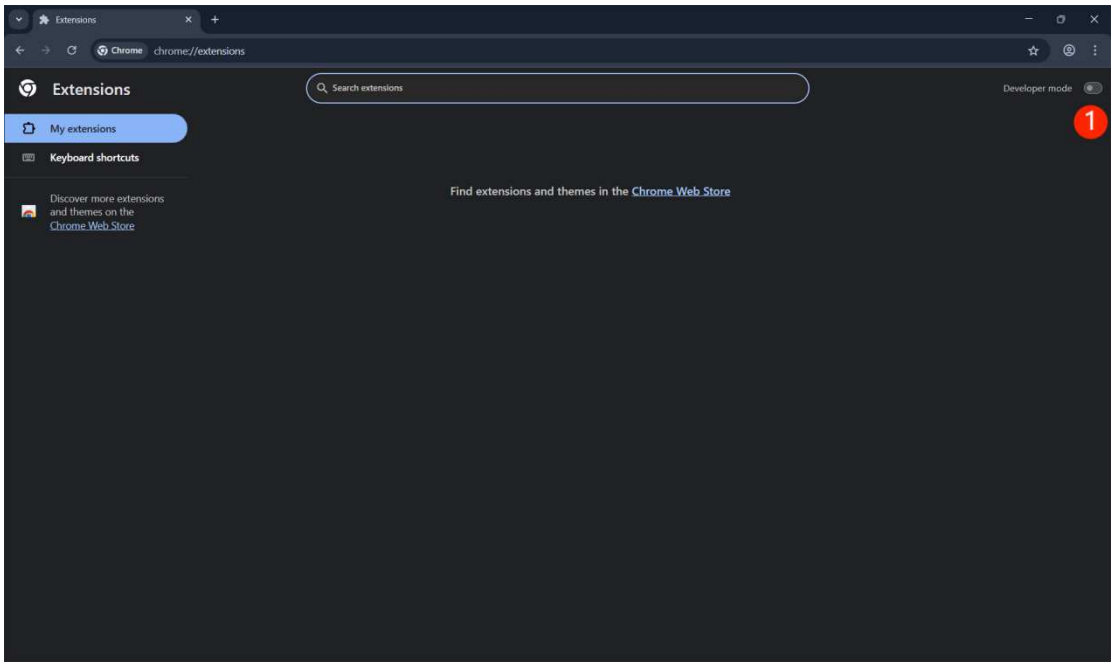
How to install AltQ in Chrome

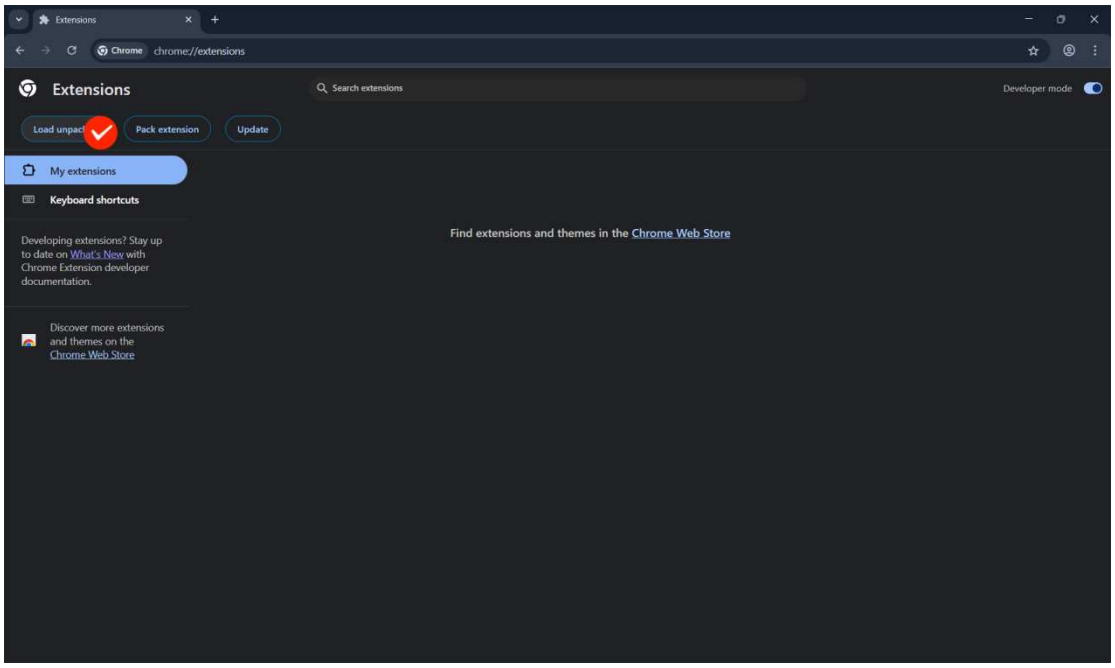
Open Chrome.

In the address bar, type:
chrome://extensions/

In the top-right corner, turn on “Developer mode”.

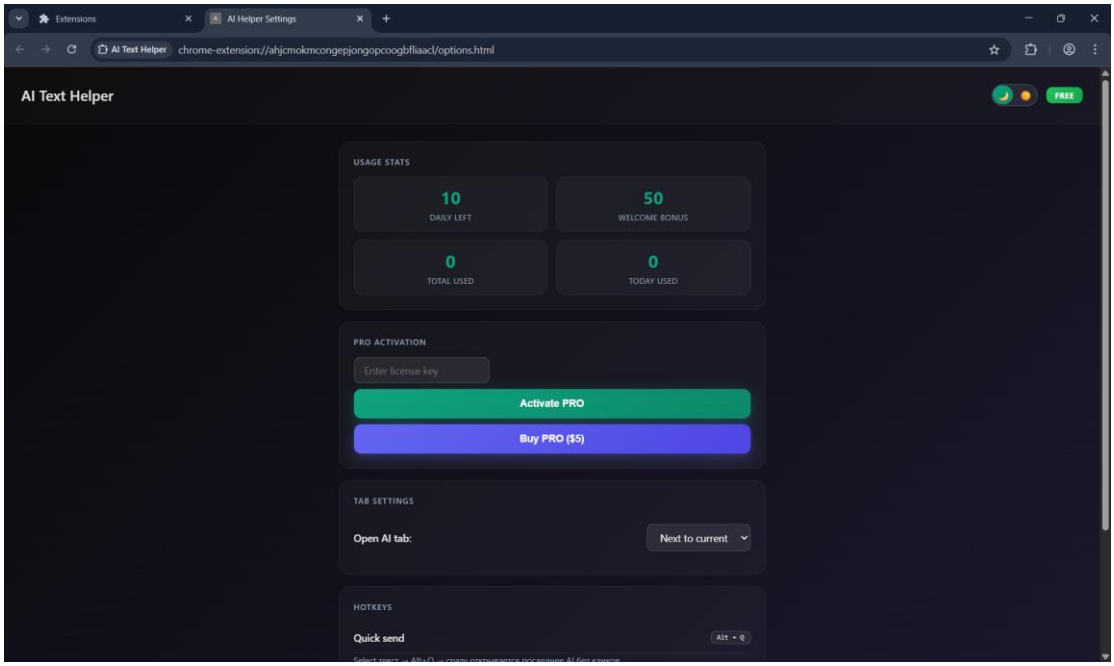


Click the “Load unpacked” button.



In the file dialog, select the folder where you unzipped AltQ
(the folder that contains manifest.json and other extension files).

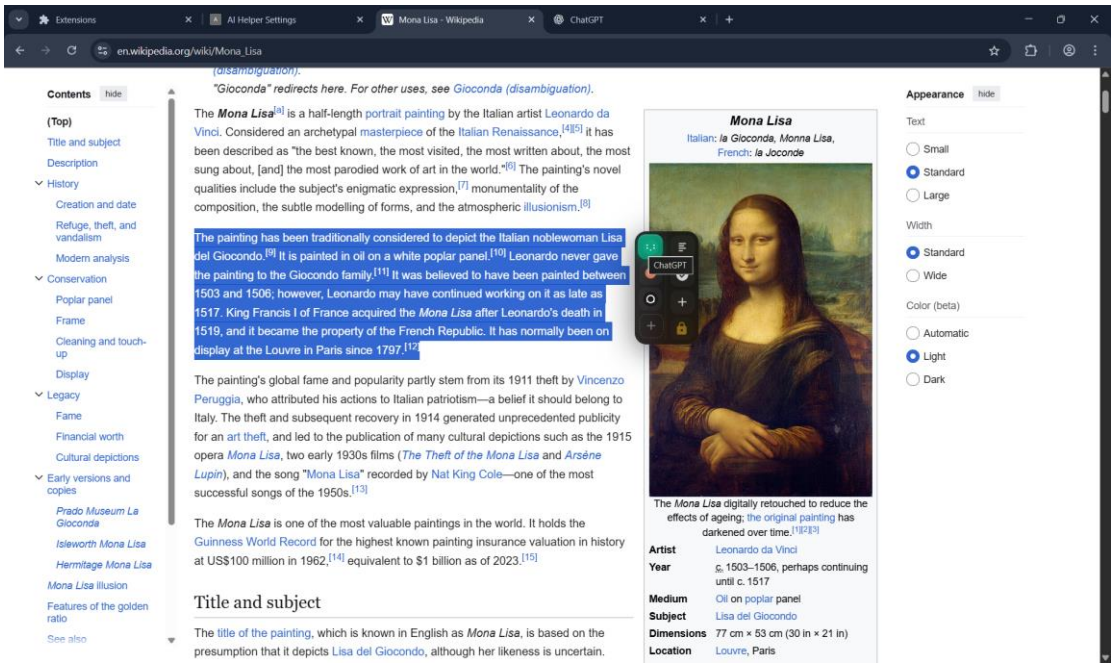
AltQ should now appear in your list of extensions.



(Optional) Log into the AI service you want to use in your browser:
– ChatGPT
– Claude
– Perplexity
– Or another AI in a separate tab

Go to any website and select some text with your mouse.

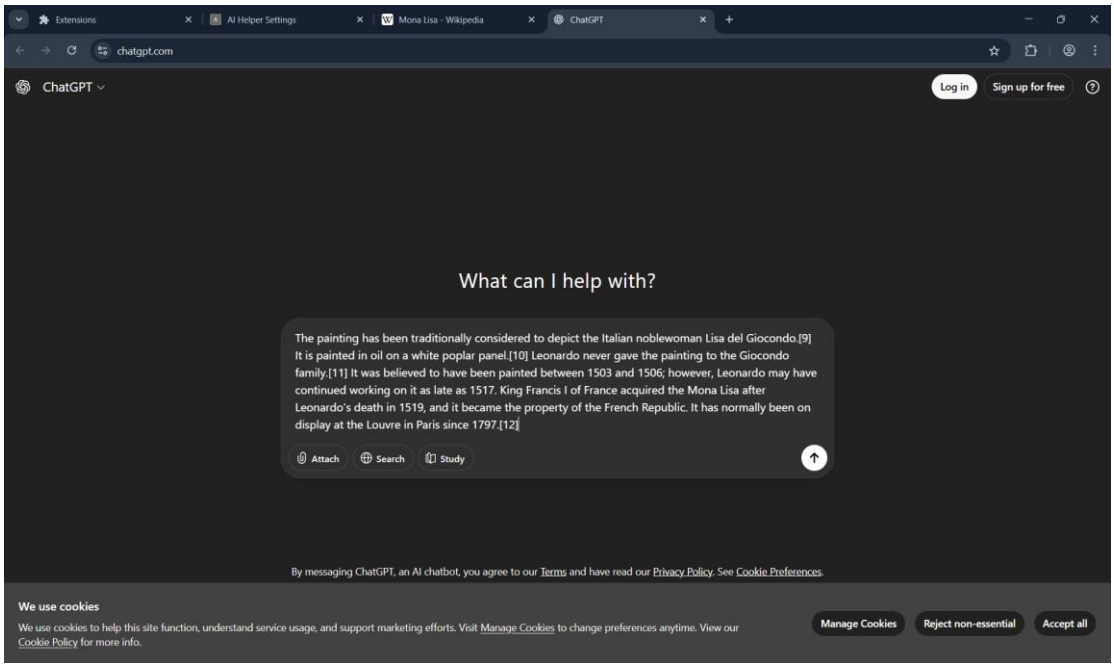
Press:
– Alt + Q on Windows
– Option (Alt) + Q on Mac



A new tab with your chosen AI will open, and the selected text will be automatically inserted into the input field. You will hear a short sound when the text is sent.

You can also choose the AI provider by clicking on its button in the popup and assign up to 4 custom AI targets (URLs) for quick access.

Note: For some external AI sites, automatic insertion may not work perfectly because each site has a different HTML structure. I will improve support for more providers over time, based on user requests.



Alpha version notice

This is an early alpha build. Some features are still placeholders (for example: “Summarize”, “Fact-check”, custom prompt wrappers) and will be activated in future updates.

Everyone who buys now gets all future updates for free.

You will receive update notifications via email through Gumroad whenever a new version is released.

Bug reports & feature requests

If you find a bug or want to request a feature, please contact me through Gumroad or by email: komahidzg@gmail.com
